The protein is used to control and participate in gene expression, by acting as transcriptional activator, strictly dependent on the presence of an intact E box (CANNTG), particularly for targeting expression of proteins to the central nervous system (CNS). The nucleic acid sequence can be used to treat nervous system disorders, and antisense sequences can be used to control mXNA transcription.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Basic helix-loop-helix polypeptide and related nucleic acid transcriptional activity, for targeting expression of genes central nervous system and treatment of nervous disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1491

The cells also have a variety of in vivo uses, e.g. for transplantation at sites of neuronal dysfunction e.g. patients with hearing or vision loss due to optical or auditory nerve damage, brain or spinal cord injuries, and neurodegenerative disorders e.g. Alzheimer's disease. The present sequence encodes murine neurogenin-3 (NGN-3), a transcription factor. NNCs differentiate into neurons through the recombinant expression of a transcription factor that induces a core program of neurogenesis. Forced expression of murine NGN3 can elicit expression of at least some neuronal phenotypic markers even in NNCs.
                                                                                                                                hearing impairment; vestibular effect; balance disorder; osteoar cellular proliferation; cerebellar granule neuron; gene therapy; mechanoreceptive cell growth; auditory; osteopathic; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The patent discloses a method for inducing non-neuronal cells (NNC) to differentiate into neurons and for NNCs to express a neuronal subtype specific marker. Transformed host cells are used as sources of neuron and other growth factors; in culture for screening compounds that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inducing non-neuronal cells to differentiate into neurons and for non-neuronal cells to express a neuronal subtype-specific marker, comprising contacting the non-neuronal cells with a vector containing neurogenin nucleic acid -
                                                                                                                                                                                                               Mouse neurogenin 3 (ngn3) cDNA,
                                                                                                                                                                                                                                                24-APR-2001

                                                                                                                                                                                                                                                                                                                                         RESULT 5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              amino acid sequence, or any of its homologues or orthologues as therapeutic agents for the treatment of deafness, partial hearing loss, cestibular effects due to damage or loss of inner hair cells, costeoarthritis and abnormal cell proliferation. The invention also encompasses methods of screening for compounds which affect the expression of an atonal -associated nucleic acid sequence in an animal, and transgenic animal in which an allele of a native atonal-associated gene is replaced by a heterologous nucleic acid sequence, thus inactivating the atonal-associated allele. The nucleic acids or proteins may be used in a method of treating an animal for hearing impairment, joint disease, balance disorders, abnormal cell proliferation, or other disease related to loss of a functional atonal-associated nucleic acid or protein. They may particularly be used to treat an animal with a cofficiency in cerebellar granule neurons or their precursors, and may also be used in promoting mechanoreceptive cell growth and generating hair cells. The present sequence represents an atonal-associated nucleic acid sequence referred to in the invention.

Note: The present sequence is not shown in the specification, but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                  animals or human for treatment of pancreatic diseases, metabolic syndrome and metabolic disorders with impaired glucose levels such as diabetes, hyperglycaemia and impaired glucose tolerance (claimed). The cells can also be used to identify compounds which stimulate beta-cell differentiation, insulin secretion or glucose responsiveness. Differentiated beta-cells can be used to study the toxic and other effects of exogenous compounds on beta-cell function. In an example from the invention, Pax6 cDNA was inserted into expression vector pACCMV.pLpA under the control of the cytomegalovirus promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        a gene which is required for the specification of the early endocrine precursor in the pancreatic epithelium and which is down-regulated once endocrine differentiation begins. The invention provides a claimed method for differentiating stem cells (especially embryonic, adult or somatic stem cells and primordial germ cells) into insulin-producing cells. This involves culturing stem cells in a suitable medium and activating at least one gene involved in beta-cell differentiation. Preferred genes including Pdx1, Pax4, Pax6 and ngn3 (see ABV15967-70). Gene activation comprises the delivery of the gene into stem cells using a viral delivery system, or the delivery of a protein product of the gene into stem cells. The insulin-producing cells can be transplanted into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of cDNA encoding the murine basic helix-loop-helix transcription factor neurogenin 3 (n a gene which is required for the specification of the early

                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 1860 BP; 397
                                                                                                                                                                                                                                                                                                                                                                                                                                                                for treating type 2 diabetes mellitus and for replacing beta cells lost to autoimmune destruction in individuals with type 1 diabetes. The method is useful in cell therapy. The present sequence is murine neurogenin 3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method for producing a mammalian islet cell. The method comprising introducing into a mammalian cell a nucleic acid molecule encoding an islet transcription factor for expression of the islet transcription factor for production of islet cell phenotype in the cell. The islet transcription factor is a neuroendocrine basic helix-loop-helix (bHLH) transcription factor. The method is useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 3; Page 89-90; 108pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Producing a mammalian islet cell for treating diabetes mellitus comprises introducing into a mammalian cell a nucleic acid molecule encoding neuroendocrine basic helix-loop-helix transcription factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   German MS,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The human neurogenin 3 Ngn3 DNA sequence AAC61089 encodes the Ngn3 CC protein AAY85617. The Ngn3 gene is located at chromosome position 10q22.1-22.2. The invention relates to the human Ngn3 nucleotide and protein sequences, and includes an antibody recognising the Ngn3 protein. Also included in the invention is a method for identifying an islet cell precursor, the method involves analysing a cell for the expression of the Ngn3 gene product, where detection of the product is indicative of an C Ngn3 gene product. The Ngn3 DNA sequence is useful as a diagnostic reagent for detecting (in a subject) a predisposition to a defect in pancreatic islet cell function or formation associated with a defect in Ngn3 activity. The Ngn3 protein is useful for identifying beta-cell C precursor cells expressing Ngn3, and to alter cellular differentiation in culture in vivo to produce new beta-cells to treat patients with diabetes mellitus. The present sequence represents the murine Ngn3 genomic DNA
                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             disease related to loss of a functional atonal-associated nucleic acid on protein. They may particularly be used to treat an animal with a deficiency in cerebellar granule neurons or their precursors, and may also be used in promoting mechanoreceptive cell growth and generating hair cells. The present sequence represents an atonal-associated nucleic acid sequence referred to in the invention.

Note: The present sequence is not shown in the specification, but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                expression of an atonal-associated nucleic acid sequence in an animal, and a transgenic animal in which an allele of a native atonal-associated gene is replaced by a heterologous nucleic acid sequence, thus inactivating the atonal-associated allele. The nucleic acids or proteins may be used in a method of treating an animal for hearing impairment, joint disease, balance disorders, abnormal cell proliferation, or other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    amino acid sequence, or any of its homologues or orthologues as therapeutic agents for the treatment of deafness, partial hearing vestibular effects due to damage or loss of inner hair cells, osteoarthritis and abnormal cell proliferation. The invention also encompasses methods of screening for compounds which affect the

                                                                                                                                                                                                                                            quantitatively characterising the corresponding transcriptome, and in detecting RNA transcripts and splice variants of human or animal transcriptomes. The libraries may also be used as specialised mini libraries to detect transcripts of a sub-transcriptome under a particular biological or pathological state, and so allowing the detection of tissue- and pathology-specific genes such as those genes only expressed in specific tissue under a specific pathological condition; to detect developmental specific genes; and to detect RNA transcripts and splice variants of a transcriptome of a patient suffering from a particular disorder. ABN27253 to ABN59589 represent oligonuclectide sequences from rats, humans and mice, which are used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                             several oligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The oligonucleotide libraries are useful for detecting mRNAs from a biological sample, in expression profiling studies, in qualitatively or
                                                                                                                                 Sequence 65 BP; 11 A; 20 C;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              messenger RNAs that populate a (sub-)transcriptome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription unit of a genome, useful for detecting tissue-, pathology-, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     28-JUL-2000;
02-MAY-2001;

                                                                                                                                                                                                                                                                     5
                                                                                                                                                                                                                                                                                                                                                                               the genome, which encodes one or more messenger RNA splice variants.

CC The oligonuclectide libraries are useful for detecting mRNAs from a biological sample, in expression profiling studies, in qualitatively or quantitatively characterising the corresponding transcriptome, and in CC detecting RNA transcripts and splice variants of human or animal CC transcriptomes. The libraries may also be used as specialised mini CC libraries to detect transcripts of a sub-transcriptome under a particular biological or pathological state, and so allowing the CC particular biological or pathology-specific genes such as those genes CC only expressed in specific tissue under a specific pathological condition, to detect developmental specific genes such as those genes CC condition, to detect developmental specific genes; and to detect RNA CC transcripts and splice variants of a transcriptome of a patient suffering CC oligonucleotide sequences from rats, humans and mice, which are used in the sequence data for this patent did not form part of the printed care transcriptome of the present invention.

The library comprises several oligonucleotides, each capable of hybridising selectively to several oligonucleotides, each capable of hybridising selectively to set of messenger RNAs transcribed from a given transcription unit of the second several oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription a genome, useful for detecting tissue-, pathology-, and

The method comprising introducing into a mammalian cell a nucleic acid molecule encoding an islet transcription factor for expression of the islet transcription factor in the cell and for production of islet cell phenotype in the cell. The islet transcription factor is a neuroendocrine basic helix-loop-helix (bHLH) transcription factor. The method is useful for treating type 2 diabetes mellitus and for replacing beta cells lost to autoimmune destruction in individuals with type 1 diabetes. The method is useful in cell therapy. The present sequence is human neurogenin 2 (Mrm.) Care
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Producing a mammalian islet cell for treating diabetes mellitus comprises introducing into a mammalian cell a nucleic acid molecule encoding neuroendocrine basic helix-loop-helix transcription factor

The Ngn3 gene is located at chromosome position 10q22.1-22.2. The invention relates to the human Ngn3 nucleotide and protein sequences, and includes an antibody recognising the Ngn3 protein. Also included in the invention is a method for identifying an islet cell precursor, the method involves analysing a cell for the expression of the Ngn3 gene product, where detection of the product is indicative of an islet cell precursor. The Ngn3 DNA sequence is useful as a diagnostic reagent for detecting (in a subject) a predisposition to a defect in pancreatic islet cell function or formation associated with a defect in Ngn3 activity. The Ngn3 protein is useful for identifying beta-cell precursor cells expressing Ngn3, and to alter cellular differentiation in culture in vivo to produce new beta-cells to treat patients with diabetes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method for producing a mammalian islet cell. The method comprising introducing into a mammalian cell a nucleic acid molecule encoding an islet transcription factor for expression of the islet transcription factor in the cell and for production of islet cell phenotype in the cell. The islet transcription factor is a neuroendocrine basic helix-loop-helix (bHLH) transcription factor. The method is useful
                                                                                                                                                                                                                         cardiovascular disorder; cardiac arrest; cerebrovascular disorder; cerebral ischaemia; angiogenesis; nervous system disorder; Alzheimer's disease; infection; ocular disorder; corneal infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Producing a mammalian islet cell for treating diabetes mellitus comprises introducing into a mammalian cell a nucleic acid molecule encoding neuroendocrine basic helix-loop-helix transcription factor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiovascular disorders e.g. cardiovascular disorders e.g. cerebrovascular disorders e.g. cerebral ischaemia, angiogenesis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to novel nucleic acids encoding novel human foetal antigens. The nucleic acids and proteins are used to prevent, treat (e.g by gene therapy) or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. The antibodies to the antigens can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunoasobent assays (ELISA). Disorders which are diagnosed or treated induncations of the condition of the condition are diagnosed or treated include authorities.
                                                                                                                                               Determining the presence of neoplastic molecular markers, by identifying the presence of markers in host test sample using neoplastic molecular marker specific reagents and analyzing the

                                                                                         PCR primers AAV42515-16 are used to isolate part of the DNA encoding a basic helix-loop-helix (BHLH) type protein, designated RELAX (Rat Embryonic Longitudinal Axis) protein. The PCR product is termed CIG235. The protein is used to control and participate in gene expression, by acting as transcriptional activator, strictly dependent on the presence of an intact E box (CANNTG), particularly for targeting expression of proteins to the central nervous system (CNS). The nucleic acid sequence can be used to treat nervous system disorders,
                                                                                                                                                                                                                                             Basic helix-loop-helix polypeptide and related nucleic acid - v transcriptional activity, for targeting expression of genes to central nervous system and treatment of nervous disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Basic helix-loop-helix; BHLH; RELAX; Rat Embryonic Longitudinal control; gene expression; transcriptional activator; targeting; protein expression; central nervous system; CNS; treatment;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             the array of reagents, allowing the identification of the neoplastic disease present. This can be used to determine the best treatment for cancers, in particular neural cell, lung and prostate tumours. The present sequence is a PCR primer useful for detecting the coding

                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                   the present invention. The neurogenin nucleic acids can be expressed a host cell, transformed using an expression vector, to produce recombinant proteins. The proteins and the antibodies raised against the proteins are useful in the study of neurogenesis.
                                                                                                                                                                                                                                                                               Claim 5; Fig 4; 106pp;

                                                                                                                                                                                                                      specific marker. Transformed host cells are used as sources of neuronal and other growth factors; in culture for screening compounds that modulate neural differentiation or as sources of recombinantly produced neurogenins and Phox2a proteins for use in transplantation. The cells also have a variety of in vivo uses, e.g. for transplantation at sites o neuronal dysfunction e.g. pattents with hearing or vision loss due to optical or auditory nerve damage, brain or spinal cord injuries, and neurodegenerative disorders e.g. Alzheimer's disease. The present sequence encodes murine neurogenin-1 (NGN-1), a transcription factor.

NNCs differentiate into neurons through the recombinant expression of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Neurogenin-1; NGN-1; non-neuronal cell; NNC; neurogenesis; Phox2a protein; neuronal subtype-specific marker; growth factor; perval differentiation; transplantation; neuronal dysfunction; optical nerve damage; auditory nerve damage, neurodegenerative disorder; neuroprotective; nootropic; anticonvulsant; antiParkinsonian; vulnerary;
                                                                                                                                                                       transcription factor that induces a core program of neurogenesis. Forced expression of murine NGN1 can elicit expression of at least some neuronal phenotypic markers even in NNCs. This can be used in autografting.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Inducing non-neuronal cells to differentiate into neurons and for non-neuronal cells to express a neuronal subtype-specific marker, comprising contacting the non-neuronal cells with a vector containing neurogenin nucleic acid -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CDS

                                                                                                                                                                                                              밁
                                                                                                                                             AAV42938
                                                                                                                                                               RESULT 20
                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                        and a transgenic animal in which an allele of a native atonal associated gene is replaced by a heterologous nucleic acid sequence, thus inactivating the atonal associated allele. The nucleic acids or proteins may be used in a method of treating an animal for hearing impairment, joint disease, balance disorders, abnormal cell proliferation, or other disease related to loss of a functional atonal associated nucleic acid or protein. They may particularly be used to treat an animal with a deficiency in cerebellar granule neurons or their precursors, and may also be used in promoting mechanoreceptive cell growth and generating hair cells. The present sequence represents an atonal-associated nucleic acid sequence referred to in the invention.

Note: The present sequence is not shown in the specification, but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           amino acid sequence, or any of its homologues or orthologues as therapeutic agents for the treatment of deafiness, partial hearing loss, vestibular effects due to damage or loss of inner hair cells, osteoarthritis and abnormal cell proliferation. The invention also encompasses methods of screening for compounds which affect the expression of an atomal-associated nucleic acid sequence in an animal,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Therapeutic use of atonal-associated nucleic acids any of its homologs or orthologs, for the treatment osteoarthritis and abnormal cell proliferation -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Atonal; homologue; orthologue; atonal-associated protein; deafness; hearing impairment; vestibular effect; balance disorder; osteoarthritis; cellular proliferation; cerebellar granule neuron; gene therapy; mechanoreceptive cell growth; auditory; osteopathic; cytostatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               neuroectodermal tumours. The method comprises measuring, in a tumour sample, expression of at least one basic bHLH gene and identifying tumour subclass by matching expression to predetermined expression profiles for known subclasses. For classifying the tumour as a medulloblastoma, the bHLH gene detected is neuroDl and neuroD3. The method is used to classify neuroectodermal tumours, and to iden medullablastoma and for prognosis of this as aggressive. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence encodes a protein which is a member of the basic helix-loop-helix (bHJH) protein family, and is designated neuroD3. The bHJH genes are a family of genes ared with vertebrate neuronal, endocrinal and gastrointestinal development. The observed pattern of neuroD expression distinguishes subclasses of neuroectodermal tumours. The specification describes a method for the classification of human the specification describes a method for the classification of human.

                                                                                                                                                                                                                                                                                                                                             those that are active in development and cancer. The resultant cell lines find use as sources of novel neural growth factors, in assays for identifying novel neuranal growth factors which can be used for screening anti-cancer drugs capable of driving terminal differentiation in neural tumours, for producing antibodies useful in diagnostic assays and for screening for compounds capable of modulating the activity of neural for transformed host cells, nucleic acids and polypeptides are also useful for treating sites of traumatic neural injury where motor or sensory neural activity has been lost, e.g. hearing or vision loss and brain or spinal cord damage. The host cells find use in the treatment of malabsorption syndromes or gastrointestinal dysmotility syndromes (Hirsh prung's Disease). The cell lines also find use in screening for candidate correcting the cellular defect caused by a defective neuroD or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          implicated in the regulation of differentiation. NeuroD proteins are particularly involved in neuronal, endocrine and gastrointestinal development. The nucleic acid is useful for constructing recombinant cell lines, transgenic embryos and animals and for quantifying the level of expression of neuroD in a cell. Birth defects and spontaneous abortions may result from expression of an abnormal neuroD protein.                                                                        Query Match
                                                                                                                       basic helix loop helix (bHLH) transcriptional activators involved in neuronal, endocrine and gastrointestinal development. They were discovered by expression cloning and screening assays designed to identify possible bHLH proteins capable of interacting with the protein product of the Drosophila daugherless gene. Novel neuroD2 and neuroD3 genes, related to neuroD1, have been identified. NeuroD nucleic acids can be used to produce NeuroD polypeptides, construction of test cell lines, as probes, in gene therapy, and to produce transgenic animals as models of disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAT74894 standard; cDNA; 1333

                                                                                                                                                                                                                                                                                                                                                                                                                                                 in the present invention. The neurogenin nucleic acids can be in a host cell, transformed using an expression vector, to prove the proteins. The proteins and the antibodies raised the proteins are useful in the study of neurogenesis.

Inducing non-neuronal cells to differentiate into neurons and for non-neuronal cells to express a neuronal subtype-specific marker, comprising contacting the non-neuronal cells with a vector contain neurogenin nucleic acid containing

Claim 1; Fig 1I; 76pp; English.

neuronal dysfunction e.g. patients with hearing or vision loss due to optical or auditory nerve damage, brain or spinal cord injuries, and neurodegenerative disorders e.g. Alzheimer's disease. The present sequence encodes murine neurogenin-2 (NGN-2), a transcription factor. NNCs differentiate into neurons through the recombinant expression of a transcription factor that induces a core program of neurogenesis. Forced expression of murine NGN2 can elicit expression of at least some neuronal The patent discloses a method for inducing non-neuronal cells (NNC) to differentiate into neurons and for NNCs to express a neuronal subtype specific marker. Transformed host cells are used as sources of neuronal and other growth factors; in culture for screening compounds that modulate neural differentiation or as sources of recombinantly produced neurogenins and Phox2a proteins for use in transplantation. The cells also have a variety of in vivo uses, e.g. for transplantation at sites of phenotypic markers even in NNCs.

                                                                                                                                                                                                                                                                                                                     Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to the use of atomal-associated nucleic acid or CC amino acid sequence, or any of its homologues or orthologues as CC therapeutic agents for the treatment of deafness, partial hearing loss, CC vestibular effects due to damage or loss of inner hair cells, CC osteoarchritis and abnormal cell proliferation. The invention also cencompasses methods of screening for compounds which affect the CC expression of an atomal-associated nucleic acid sequence in an animal, and a transgenic animal in which an allele of a native atomal-associated CC gene is replaced by a heterologous nucleic acid sequence, thus consider the atomal-associated allele. The nucleic acids or proteins may be used in a method of treating an animal for hearing impairment, CC joint disease, balance disorders, abnormal cell proliferation, or other CC disease related to loss of a functional atomal-associated nucleic acid or protein. They may particularly be used to treat an animal with a considering in cereballar granula neurons or their precursors, and may call sequence represents an atomal-associated nucleic acid or the invention.

CC deficiency in cereballar granula neurons or the received in the invention.
                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                         Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to the use of atonal-associated nucleic acid or CC amino acid sequence, or any of its homologues or orthologues as CC therapeutic agents for the treatment of deafness, partial hearing loss, CC vestibular effects due to damage or loss of inner hair cells, CC osteoarthritis and abnormal cell proliferation. The invention also CC encompasses methods of screening for compounds which affect the cC expression of an atonal-associated nucleic acid sequence in an animal, CC and a transgenic animal in which an allele of a native atonal-associated CC gene is replaced by a heterologous nucleic acid sequence, thus CC inactivating the atonal-associated allele. The nucleic acids or proteins CC inscription and method of treating an animal for hearing impairment, CC joint disease, balance disorders, abnormal cell proliferation, or other CC disease related to loss of a functional atonal-associated nucleic acid or grotein. They may particularly be used to treat an animal with a CC deficiency in cerebellar granule neurons or their precursors, and may CC also be used in promoting mechanoreceptive cell growth and generating contact of the colls when research semence represents an armal-associated mucleic calls of the present semence represents an armal-associated mucleic calls of the present semence represents an armal-associated mucleic calls of the present semence represents an armal with a colls of the present semence represents an armal-associated mucleic calls of the present semence represents an armal-associated mucleic calls of the present semence represents an armal call associated mucleic calls of the present semence represents an armal-associated mucleic call of the present semence represents an armal-associated mucleic call of the present semence represents an armal-associated mucleic call of the present semence represents an armal-associated mucleic call of the present semence represents an armal-associated mucleic call of the present semence represents an armal call call of the present semence the p

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                amino acid sequence, or any of its homologues or orthologues as therapeutic agents for the treatment of deafness, partial hearing loss, vestibular effects due to damage or loss of inner hair cells, osteoarthritis and abnormal cell proliferation. The invention also encompasses methods of screening for compounds which affect the expression of an atonal-associated nucleic acid sequence in an animal, and a transgenic animal in which an allele of a native atonal-associated gene is replaced by a heterologous nucleic acid sequence, thus inactivating the atonal-associated allele. The nucleic acids or proteins may be used in a method of treating an animal for hearing impairment, joint disease, balance disorders, abnormal cell proliferation, or other these areas and models acid acid and models acid and the second treating and animal for hearing impairment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     protein. They may particularly be used to treat an animal with a deficiency in cerebellar granule neurons or their precursors, and may also be used in promoting mechanoreceptive cell growth and generating hair cells. The present sequence represents an atonal-associated nucleic acid sequence referred to in the invention.

Note: The present sequence is not shown in the specification, but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Therapeutic use of atonal-associated nucleic acids or amino acids, or any of its homologs or orthologs, for the treatment of e.g. deafness, osteoarthritis and abnormal cell proliferation -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WO200073764-A2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method for generating insulin-secreting cells (c) from precursor stem cells or adult pancreatic exocrine cells. The method (c) comprises exposing the precursor cells or exocrine cells to: a nucleic acid molecule encoding neurogenin 3 (ngm3) or NeuroD/beta2; or an (c) activator of ngm3 or NeuroD/beta2 gene expression, under conditions (c) effective to generate the insulin-generating cells from the precursor or (c) exocrine cells. The invention is useful in generating insulin-secreting (c) cells from precursor stem cells or adult pancreatic exocrine cells is (c) cuseful for generating glucose sensitive insulin secreting beta cells (s) cuseful for generating glucose sensitive insulin secreting beta cells (s) contable for transplantation, and for in situ development of insulin-correcting cells in a patient. The method is also useful for preventing compounds that prevent or activate beta (cells and for identifying compounds that prevent or activate beta (cell differentiation. The present sequence is human RT-PCR primer for isolation of neurogenin-3 DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               from precursor stem cells or adult pancreatic exocrine cells. The method comprises exposing the precursor cells or exocrine cells to: a nucleic acid molecule encoding neurogenia (ngm3) or NeuroD/beta2; or an activator of ngm3 or NeuroD/beta2 gene expression, under conditions effective to generate the insulin-generating cells from the precursor or exocrine cells. The invention is useful in generating insulin-secreting cells from precursor stem cells or adult pancreatic exocrine cells is useful for generating glucose sensitive insulin secreting beta cells susful for transplantation, and for in situ development of insulin-secreting premature differentiation of precursor stem cells into insulin-secreting beta cells and for identifying compounds that prevent or activate beta petial differentiation than the precursor of the petial definition of the petial to the petial of the petial to the petial definition of the petial to the peti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human;

The method comprising introducing into a mammalian cell a nucleic acid molecule encoding an islet transcription factor for expression of the islet transcription factor in the cell and for production of islet cell phenotype in the cell. The islet transcription factor is a neuroendocrine basic helix-loop-helix (bHLH) transcription factor. The method is useful for treating type 2 diabetes mellitus and for replacing beta cells lost to autoimmune destruction in individuals with type 1 diabetes. The method is useful in cell therapy. The present sequence is human neurogenin 1
                                                                                                                                                             Nucleic acid encoding neurogenic differentiation polypeptide - useful e.g. in regulating neuronal, endocrine and gastrointest
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Neurogenic differentiation protein; NeuroD; neuroD3 gene; transcriptional activator; neuron; pancreas; gastrointestine; knock-out mouse; transgenic animal; cancer; diabetes; gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human neurogenic differentiation protein (NeuroD3) DNA clone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              02-OCT-1997

NeuroD polypeptides are tissue-specific basic-helix-loop-helix (bHLH) transcriptional activators involved in neuronal, endocrine and gastrointestinal development. They were discovered by expression cloning and screening assays designed to identify possible bHLH proteins capable of interacting with the protein product of the Drosophila daugherless gene. Novel neuroD2 and neuroD3 genes, related to neuroD1, have been identified. NeuroD noulclic acids can be used to produce NeuroD polypeptides, construction of test cell lines, as probes, in gene therapy, and to produce transgenic animals as models of disease.
The present sequence encodes a protein which is a member of the basic helix-loop-helix (bHLH) protein family, and is designated neuroD3. The bHLH genes are a family of genes associated with vertebrate neuronal, endocrinal and gastrointestinal development. The observed pattern of neuroD expression distinguishes subclasses of neuroectodermal tumours. The specification describes a method for the classification of human
                                                                                                                                                                                                                                                                        Classifying neuroectodermal tumours from expression pattern of basic-helix-loop-helix genes - especially for identifying medulla:blastoma and assessing its aggressiveness, specifically associated with expression of BHLH genes neuroD 1-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  07-AUG-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      neuroectodermal tumours. The method comprises measuring, in a tumour sample, expression of at least one basic bHLH gene and identifying the tumour subclass by matching expression to predetermined expression profiles for known subclasses. For classifying the tumour as a medulloblastoma, the bHLH gene detected is neuroD1 and neuroD3. The method is used to classify neuroectodermal tumours, and to identify medullablastoma and for prognosis of this as aggressive. (Updated on 25-MAR-2003 to correct PR field.)
                                                     New neurogenic differentiation gene, useful in gene therapy to correct traumatic neural injury that has resulted in loss of motor or sensory neural function and for constructing recombinant cell lines -
                                                                                                                                                                                                                                                                                                                                                               30-OCT-1996;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       lines, transgenic embryos and animals and for quantifying the level of expression of neurol in a cell. Birth defects and spontaneous abortions may result from expression of an abnormal neurol protein. The polynucleotide sequences permit the establishment of primary cultures of proliferating embryonic neuronal stem cells under conditions minicking those that are active in development and cancer. The resultant cell lines find use as sources of novel neural growth factors, in assays for identifying novel neuronal growth factors which can be used for screening anti-cancer drugs capable of driving terminal differentiation in neural tumours, for producing antibodies useful in diagnostic assays and for screening for compounds capable of modulating the activity of neurol.
                                                                                                                                                                                                                                                                                                                                                                                                                                                CDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Transformed host cells, nucleic acids and polypeptides are also useful for treating sites of traumatic neural injury where motor or sensory neural activity has been lost, e.g. hearing or vision loss and brain or spinal cord damage. The host cells find use in the treatment of malabsorption syndromes or gastrointestinal dysmotility syndromes (Hirsh Prung's Disease). The cell lines also find use in screening for candidate therapeutic agents capable of either substituting for neuron or correcting the cellular defect caused by a defective neuron. The sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  correcting the cellular defect caused by a defective ne presented is the human neuroD3 genomic DNA, clone 20A1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 implicated in the regulation of differentiation. NeuroD proteins are particularly involved in neuronal, endocrine and gastrointestinal development. The nucleic acid is useful for constructing recombinant cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    functionally active human neuroD3 polypeptide. NeuroD proteins represent a new family within the basic-helix-loop-helix (bHLH) family which are

The bHLH genes are a family of genes associated with vertebrate neuronal, endocrinal and gastrointestinal development. The observed pattern of neuroD expression distinguishes subclasses of neuroectodermal tumours. The specification describes a method for the classification of human neuroectodermal tumours. The method comprises measuring, in a tumour sample, expression of at least one basic bHLH gene and identifying the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       development. The nucleic acid is useful for constructing recombinant cell clines, transgenic embryos and animals and for quantifying the level of cexpression of neuroD in a cell. Birth defects and spontaneous abortions may result from expression of an abnormal neuroD protein. The complete embryosic neuronal stem cells under conditions mimicking those that are active in development and cancer. The resultant cell lines of groliferating embryonic neuronal stem cells under conditions mimicking those that are active in development and cancer. The resultant cell lines of find use as sources of novel neural growth factors, in assays for cell dentifying novel neuronal growth factors, in assays for continuous, for producing antibodies useful in diagnostic assays and for screening for compounds capable of minimal differentiation in neural culturers, for producing antibodies useful in diagnostic assays and for screening for compounds capable of modulating the activity of neuron. Transformed host cells, nucleic acids and polypeptides are also useful for treating sites of traumatic neural injury where motor or sensory companies of the cells find use in the treatment of malabsorption syndromes or gastrointestinal dysmotility syndromes (Hirsh crecital in the cell lines also find use in screening for candidate thoracters in the cell lines also find use in screening for candidate correcting the cellular defect caused by a defective neuron. The sequence

It was used to provide sequence information for the cloning of Neuron2 cDNA, which was used to transfect cultured epidermal cells. This was part of a novel method for transdifferentiating an epidermal basal cell into a cell having the morphological, physiological and/or immunological features of a viable neuronal cell. The method is useful for screening new drugs for treating a nervous system disorder, or for isolating a novel nerve growth factor. The transdifferentiated cell is useful in both cell and gene therapies aimed at alleviating various neurological disorders. The cell or gene therapy approach involves the use of autologous transplantation or grafting of the newly created neuronal cells as treatment for brain or spinal cord injury, stroke and neurodegenerative diseases (e.g. Parkinson's disease, Huntington's disease or Alzheimer's
                                                                                                                                                                                             Human;

The method comprising introducing into a mammalian cell a nucleic acid molecule encoding an islet transcription factor for expression of the islet transcription factor in the cell and for production of islet cell phenotype in the cell. The islet transcription factor is a neuroendocrine basic helix-loop-helix (bHHH) transcription factor. The method is useful for treating type 2 diabetes mellitus and for replacing beta cells lost to autoimmune destruction in individuals with type 1 diabetes. The method is useful in cell therapy. The present sequence is human neurogenin 1
                                                                                                                                                                                                                                                                       31-JAN-2000;

                                                 The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encoding a protein of the invention.

These can be use in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encoding protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI;

(I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I) additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. AAK64703
